

Imperial Oil

These presentations contain forward-looking information on future production, project start-ups and future capital spending. Actual results could differ materially due to changes in market conditions, law, government policy, costs, project schedules, operating performance, demand for oil and natural gas, commercial negotiations or other technical and economic factors.

Oil-equivalent barrels (OEB) may be misleading, particularly if used in isolation. An OEB conversion ratio of 6,000 cubic feet of natural gas to one barrel of oil is based on an energy-equivalency conversion method primarily applicable at the burner tip and does not represent a value equivalency at the wellhead.
